

influenced by

- ▶ Cinema 4D
- ▶ TikZ,  $\LaTeX$
- ▶ CAD
- ▶ programming (e.g. matplotlib, QPainter)
- ▶ paradigms (cf. programming)

# influenced by Cinema 4D

- ▶ intuitive to use
- ▶ few central managers
  - ▶ viewport
  - ▶ object tree (objects, generators, tags)
  - ▶ attribute manager

- ▶ programming: two assessments
  - ▶ quality of code (readability, maintainability, ...)
  - ▶ quality of product (no bugs, speed, usable, ...)
- ▶ software engineering principles (SE-principles):
  - ▶ avoid code duplication
  - ▶ abstraction
  - ▶ stick to paradigms (procedural, functional, oo, structural, ...)
  - ▶ apply patterns

- ▶ vector graphics: single assessment
  - ▶ beauty of the result (colors, shapes, content, ...)
- ▶ fundamental idea:
  - ▶ transfer SE-principles to vector graphics

- ▶ avoid duplicates
- ▶ procedural, structural, **object oriented**
- ▶ non-destructive

- ▶ KISS
- ▶ user *understands* the application  $\Rightarrow$  no unexpected behaviour
- ▶ very few entities with clear responsibility
  - ▶ object
  - ▶ viewport
  - ▶ object tree
  - ▶ attribute manager
  - ▶ tag

# object

- ▶ has ...
  - ▶ ...a parent and children
  - ▶ ...attributes
  - ▶ ...coordinate system (relative to parent, aka. “local transformation”)
- ▶ does something
  - ▶ displays geometry
  - ▶ modifies it's children
  - ▶ acts as group

objects: empty

- ▶ supply a new coordinate system
- ▶ supply user-attributes
- ▶ grouping
- ▶ attributes: name, coordinate system

## objects: rectangle

- ▶ shows a rectangle
- ▶ attributes: like empty + width, height, corner radius, ...
- ▶ similar: *ellipse*, *star*, *n-gon*, ...
- ▶ can convert to *path*

## objects: path

- ▶ shows any path (aka. spline)
- ▶ attributes: like empty + interpolation, is-closed, ...

## objects: generators

object	adds	attributes (plus <i>empty</i> -attributes)
<i>mirror</i>	mirrored clone	-
<i>cloner</i>	many clones	count, shape, mode: (linear/circular/path)
<i>boolean</i>	result of boolean	mode: (and, or, xor, not, ...)
<i>instance</i>	single clone	ref to source

- ▶ mirrored/cloned object: first children
- ▶ *boolean*: apply operator to first two (all?) children
- ▶ *cloner* and *boolean* make hide their children. Only result is visible.
- ▶ *instance*: no special children

# object tree

- ▶ relationship between objects (parent-child) is crucial
- ▶ encourage use of well-designed object tree dialog
- ▶ drag-and-drop to set parent/children
- ▶ select objects
- ▶ manage tags

# attribute manager

- ▶ each object has attributes (see above)
- ▶ almost every aspect of the scene file is an attribute
- ▶ display/edit attribute of selected objects
- ▶ tags have attributes, too

# viewport

- ▶ WYSIWYG
- ▶ select objects
- ▶ manipulate transformation of object (translate, rotate, scale)

# tags

- ▶ attached to any object, each tag knows its owner object.
- ▶ model features that do not fit into the object tree
  - ▶ effects: bend, distort, outline, ...
  - ▶ constrain attribute
  - ▶ style
  - ▶ script

# scripting

- ▶ make attribute system available to scripting language
- ▶ python ?
- ▶ user can define new attributes in any object (user-attribute)
- ▶ script-tag can access attributes from owner and its children

# templates

- ▶ user defines an empty
  - ▶ with some user-attributes
  - ▶ with script-tag
  - ▶ with some children that “do” something
- ▶ script-tag uses user-attributes to set attributes of the children
- ▶ *template-object*: like *instance*, but with free top-level attributes

# features

- ▶ multi-selection attribute
  - ▶ usable attribute manager, though multiple objects are selected
  - ▶ display only intersection of attributes
  - ▶ display value only if it is the same
  - ▶ set values like +1, \*2 smartly

# Open Questions

- ▶ start from scratch or extend existing oss?
  - ▶ Inkscape?
- ▶ separate material and geometry?
  - ▶ uncommon in 2D, but common in 3D
- ▶ file format
  - ▶ XML, JSON, binary, ...
